Luggage Volume	16 ft^3 (4D)
Engine Characteristics	NA
Trans Characteristics	CLKUP

How are fuel cost estimates and miles on a tank determined?

Fuel cost estimates are based on 45% highway driving, 55% city driving, 15000 annual miles and a fuel cost of $ 2.24 per gallon . You may customize these values to reflect the cost of fuel in your area and your own driving patterns.

Fill-up cost and the distance you can travel on a tank are calculated based on the combined MPG and the assumption that you will re-fuel when your tank is 10% full.

What's the difference between air pollution and greenhouse gas emissions?

Air pollution refers to vehicle emissions that are harmful to human health and/or cause smog. Greenhouse gases refer to emissions that cause global climate change.

Why do some vehicles have more than one air pollution score?

Some vehicles are available in multiple emission versions that look the same but have different air pollution scores. Unfortunately, it is difficult to distinguish between similar models.

If you click on the link "Show Detailed Air Pollution Information" above, it will display the emission standard and the 12-digit underhood engine ID. You can identify the cleaner car by matching the engine ID listed above to the Underhood Label Identification Number on the vehicle.

Note: In some cases, manufacturers choose to certify identical vehicles to different emission standards. In these cases, the vehicles will have the same engine ID.

Greenhouse gas emissions expressed in CO2 equivalents. The greenhouse gas estimates presented here are "full fuel-cycle estimates" and include the three major greenhouse gases emitted by motor vehicles: carbon dioxide, nitrous oxide, and methane. Full fuel-cycle estimates consider all steps in the use of a fuel, from production and refining to distribution and final use. Vehicle manufacture is excluded. (U.S. Department of Energy, GREET Model, Argonne National Laboratory)
